Assignment #01
Question 3:
Chapter 2
Exercise 2.9

1. Problem Statement

A consultancy firm provides consultancy ..... manages the leasing of cars and provides secretary services.

Step 1:

Identify Case Types
Only properties that lead to different organisational behaviour are used to classify cases.

Case Property	Case Type	Why it matters
1. Customer Type	New Client, Existing Client	New clients get a framework contract during intake; existing clients do not but get regular relationship meetings.
2. Service Type	Consultancy, Outsourcing, Interim management	Project execution differs largely per service type. Team creation applies only to consultancy and outsourcing.
3. Internal customer	consultants of the firm	The service department serves the firm's own consultants, not external clients.

Properties deliberately not used

- Service type is not used for acquistion and intake, because all services are acquired with the same fixed procedure and the same intake form.
- Customer type is not used for project delivery, because delivery does not depend on whether the client is new or existing.

The resulting case type are: New Client, Existing Client, Consultancy, Outsourcing, Interim Management, Internal consultants.

Step 2:

Identify Functions

	Group	#	Function
1	Acquisition and relationship	F1	Acquisition
		F2	Intake with the client
		F3	Establish framework contract
		F4	Regular client meetings
2	Project delivery	F5	create project team
		F6	Kick-off meeting
		F7	Project execution
		F8	Evaluation meeting
3	Support services	F9	Market research
		F10	Manage leasing of cars
		F11	Secretary services

Step 3
Case/Function Matrix

Function	New Client	Existing Client	Consultancy	Outsourcing	Interim mgmt	Internal
F1 Acquisition	x	x				
F2 Intake	x	x				
F3 Framework	x					
F4 Regular Meeting		x				
F5 Create Project Team			x	x		
F6 Kick-off meeting			x	x	x	
F7 Project execution			x	x	x	
F8 Evaluation meeting			x	x	x	
F9 Market Research						x
F10 Car leasing						x
F11 Secretary services						x

Splitting the matrix. The x's can be partitioned without losing any of them, so the matrix is split into three smaller matrices.

Matrix A: Acquisition and relationship

Function	New Client	Existing Client
F1 Acquisition	x	x
F2 Intake	x	x
F3 Framework contract	x	
F4 Regular meeting		x

__/__/202 Day:_____

Matrix B:- Project delivery

Function	Consultancy	Outsourcing	Interim mgmt
F5 Create Project team	X	X	
F6 Kick-off meeting	X	X	X
F7 Project execution	X	X	X
F8 Evaluation meeting	X	X	X

Matrix C :- Support Services

Function	Internal
F9 Market Research	X
F10 Car leasing	X
F11 Secretary Services	X

Step 4:-

Identify Processes

Each matrix starts as one big process and is split only where a guideline applies.

Matrix A:- Acquisition and relationship

- Split between acquisition and regular meetings. Acquisition and intake work on a project opportunity, which is the flow object; while regular meetings work on the relationship with an existing client.

Acquisition is triggered by an interest from a client, while regular meetings recur periodically. So F4 becomes its own process.

CamScanner

- No split between new and existing clients. For new clients there is only one extra function, the framework contract. That is no 'many more' functions, so one Project Acquisition process serves both. This also fits the case, which says acquisition concern projects rather than clients.

Matrix B: Project delivery

- No split within a project. Team creation, kick-off, execution all work on the same flow object, a single project and each happens once per project.
- Split per service type. Service type is a relevant dimension that forces the work to be performed differently, because project execution differs largely per type of service. Interim management also lacks the team-creation function, so it covers fewer function than the other two.
- Reuse. The kick-off and evaluation meetings are the same for every project type, so they can later be modelled once and reused as shared sub-processes.

Matrix C: support services

- Split per services. Market research works on a research request, car leasing works on a leased car and its lease contract, and secretary services work on a secretarial request. These flow objects are different

and the services are unrelated, so each becomes its own process.

Guidelines:

G1:- different flow objects
G2:- the flow object changes multiplicity
G3:- the process changes transactional state.
G4:- a logical separation in time.
G5:- a logical separation in space.
G6:- a logical separation in another relevant dimension.
G7:- the split exists in a reference model.
G8:- one case type needs many more functions than another.

Resulting Process Architecture

#	Process	Function	Case Type	Guidelines
P1	Project Acquisition	F1, F2, F3	New Client, Existing	G1, G3
P2	Client Relationship	F4	Existing Client	G1, G4
P3	Consultancy Project Delivery	F5-F8	Consultancy	G6, G8
P4	Outsourcing Project Delivery	F5-F8	Outsourcing	G6, G8
P5	Interim Mng Project	F5-F8	Interim Management	G6, G8
P6	Market Research	F9	Internal	G1
P7	Car leasing Management	F10	Internal	G1
P8	Secretary Services	F11	Internal	G1

__/__/202 Day:_____

Project Architecture.

Acquisition and relationship (core)

P1 Project Acquisition	P2 Client relationship
F1 to F3, new + existing	F4, existing clients

↓

Project delivery (core)

P3 Consultancy	P4 Outsourcing
Function F5 to F8	Function F5 to F8

P5 Interim Managmt
Function F6 to F8

Support Process (service department)

P6 Market Research	P7 car leasing
Function F9	Function F10

P8 Secretarial
Function F11
